THE APPLICATION OF MERCY: EQUAL TREATMENT FOR ALL YOUTH WHO COMMIT SEX OFFENSES

Jennica Janssen*

David DeMatteo**

ABSTRACT

Both adults and youth who commit sex crimes may be mandated to register in their community as sex offenders. Depending on the laws governing the jurisdiction and the type of crime committed, a youth who commits a sex crime could be labeled a sex offender for the rest of their life. As minority youth, including lesbian, gay, bisexual, transgender, and questioning (LGBTQ) youth, are disproportionately represented in the juvenile justice system, sex offender notification and registration laws have the consequences of adversely affecting the most vulnerable children in the community.

This article discusses the current state of the field regarding sex offender registration and notification laws, as well as the relevant social science research. It also examines the current juvenile justice reform movement in the area and provides a discussion about opposite-sex offender-victim prosecution in contrast with same-sex offender-victim prosecution. Finally, this article presents a study examining current public opinion regarding the registration requirements for opposite-sex offender-victim crimes compared to same-sex offender-victim crimes. Despite the results not supporting our original hypothesis, they still highlight the intense stigma facing all youth who are convicted of sex crimes. The results of this research study are considered in light of the recently released National Council of Juvenile and Family Court Judges resolution about the prosecution and treatment of youth who commit sex offenses.

V. CONCLUSION: A PROPOSED SOLUTION–EQUAL TREATMENT FOR ALL YOUTH WHO COMMIT SEX CRIMES

I. INTRODUCTION

As a seventeen-year-old high school senior in an urban city, Eric Smith enjoyed spending time with friends, playing basketball, and going to concerts. Eric did not particularly enjoy his classes, but he attended school regularly, as he was looking forward to graduating in 2018. However, he mostly attended so he could spend time with his fifteen-year-old boyfriend. They were in a committed, mutually-caring relationship, but they were not open about their relationship because they were unsure how their friends and family would react. They had been dating for a year and had recently started having sex. While Eric was his boyfriend’s first sexual partner, Eric had other partners the summer before his sophomore year. In Eric’s experience, sharing naked photographs with one another was a way for the couple to be intimate when they were not able to physically be together.

One evening, Eric’s boyfriend left his phone unattended in the kitchen of his home. When his boyfriend’s father saw Eric’s explicit

1 This fictional vignette is based off a true case and used to illustrate the possible background story of a youth who is required to register as a sex offender for life. See generally, State v. Gray, 402 P.3d 234 (Wash. 2017). See also NICOLE PITTMAN & ALISON PARKER, RAISED ON THE REGISTRY: THE IRREPARABLE HARM OF PLACING CHILDREN ON SEX OFFENDER REGISTRIES IN THE US (Human Rights Watch ed., 2013) [hereinafter HUMAN RIGHTS WATCH].

message appear on the screen, he became infuriated. He confronted his son about his same-sex relationship, and his son confessed that he was dating Eric and that they were in love. Angered, the boyfriend’s parents informed law enforcement.

Eric was charged with possession and distribution of child pornography, for both the pictures of his boyfriend and himself. Although he was adjudicated delinquent in juvenile court and sentenced to serve sixty months of probation, this was considered lenient under the laws of the state. As a condition of his sentencing, Eric was required to register as a sex offender for the rest of his life.

When Eric turned eighteen years-old, during that school year, his status as a sex offender became a matter of public record even though he was still in high school. Within one week, the entire community was aware that there was a sex offender living amongst them. He was ostracized by other students and his family had to move because they resided too close to a school, a violation of the residency restrictions which apply to registered sex offenders. Eric took comfort in the fact that he was leaving for college shortly and circumstances would be different in another state where no one knew what happened.

Although he moved to a new place, Eric could not leave the sex offender registry behind. The sex offender registry and Eric’s information were easily accessible to anyone who went to the public website and searched the area. Once, on his new college campus, he was harassed by the police and by his peers. He dropped out of college after one semester and began working. After a string of failed relationships, Eric grew frustrated explaining to his partners why he was a registered sex offender. He moved to yet another state for a fresh start.

Eric registered with law enforcement in the new state and found a job. He met his partner, fell in love, and had two children. Although he could not take his children to school or attend their after-school activities, he took pride in being a loving and supportive father. Eric was the primary income-earner and supported his family. However, his company relocated its office building next to a playground, and Eric had to quit because he did not want to violate the sex offender residency restrictions. Now age thirty, Eric finds himself with limited job prospects, a family to support, and no income. While he has tried multiple times to move past the events that

3 Adjudicated delinquent is used to describe a finding of guilt in juvenile court judgment, but it is not considered a conviction.

4 PA. JUVENILE INDIGENT DEFENSE ACTION NETWORK, THE PENNSYLVANIA JUVENILE COLLATERAL CONSEQUENCES CHECKLIST 2 (2015) (stating that a juvenile adjudication is analogous to an adult misdemeanor or felony).
occurred when he was a senior in high school, his life was defined by acting like many other in love teenagers do in the twenty-first century.

A version of Eric’s story happens to far too many young people across the United States. Labeling youth with the scarlet letter of “sex offender” has costly consequences that essentially prevent the individual from ever leading a normal life, including maintaining a job, fostering relationships, and living wherever the person desires. This economic and educational deprivation is aggravated by the detrimental psychological and physiological effects these individuals experience because of the stigma and restrictions associated with being a registered sex offender. Individuals like Eric are particularly vulnerable to harsher punishments and stricter registration laws because of their sexual orientation. This article reviews and investigates sexual crimes involving adolescents, specifically how the pairing of the offender’s sex and the victim’s sex contribute to punishment, registration, and public opinion regarding the offense.

In order to discuss the current state of juvenile sex offender legislation and reform efforts, it is essential to understand the historical context. Although laws meant to punish sex crimes previously existed, three particularly heinous crimes committed against young children by convicted sex offenders led to the creation of federal and state laws aimed at protecting vulnerable children. First, the Jacob Wetterling Crimes Against Children and Sexually Violent Offender Registration Act of 1994 (the Wetterling Act) required states to create programs to monitor people who were convicted of a crimes against a minor or a sexually violent offense. Megan’s Law, an amendment to the Wetterling Act, permitted sex offender registry information collected by these monitoring programs to be released for any

6 Id.
The Pam Lychner Sexual Offender Tracking and Identification Act of 1996 established a national Federal Bureau of Investigations database with photographs, fingerprints, and current addresses of individuals who have been convicted of a sex offense. Tougher sanctions and lengthier prison terms were also created as specific and general deterrents for sex crimes.

The creation of the federal Adam Walsh Child Protection and Safety Act of 2006 (the Adam Walsh Act) extended the fear and misconception that individuals who commit sex offenses recidivate at a higher rate than other criminal offenders, and further creates a generalized notion that such individuals are not amenable to treatment. The Adam Walsh Act included young offenders on the sex offender registry and required states to comply with the Sexual Offender Registration and Notification Act (SORNA) of 2006. SORNA requires states to place those convicted of sex offenses on the public registry if they meet certain criteria, making the offender’s name, past offenses, and current residence and workplace accessible through state sex offender websites. Although the original drafting of SORNA did not encompass youth offenders, the Amie Zyla provision of SORNA, as reflected in the Adam Walsh Act, included juveniles for certain offenses.

Part II of this article gives a general introduction to juvenile sex offender registration and notification laws, as well as the relevant research. Part III examines the current state of juvenile justice reform in this area, addresses discrepancies between research findings and current law, and

18 See infra Part II.
provides a discussion contrasting opposite-sex offender-victim prosecution with same-sex offender-victim prosecution. Part IV contributes to the research by investigating the public opinion of the offense severity and registration requirements for opposite-sex offender-victim crimes compared to same-sex offender-victim crimes. This article concludes in Part V by arguing the importance of adhering to the new resolution regarding sex offender registration for all youth.

II. WHERE WE ARE NOW: YOUTH WHO COMMIT SEX OFFENSES

Juvenile courts were created at the turn of the nineteenth century as an alternative to adult courts because children needed to be treated differently. The juvenile justice system focused on the welfare of children as “children were not of full legal capacity,” and it was essential for the state to “provide protection for children whose natural parents were not providing appropriate care or supervision.” It was believed that youth were more capable of being saved from a life of crime, and, therefore, more amenable to treatment. Regrettably, the United States began using more punitive measures—such as trying youth in adult court or imposing longer prison sentences—and moved away from the rehabilitation of justice-involved youth. Despite research demonstrating that justice-involved youth are capable of rehabilitation, the United States has continued to criminalize youth offenses and decrease the separation between the juvenile and adult justice systems.

Before examining the treatment of same-sex offender-victim crimes compared to opposite-sex offender-victim crimes, it is important to understand the current status of juvenile sex offender legislation and efforts
to reform this system. Section A explains the present state of the legal system with regards to prosecution of youth who commit sex offenses. Section B discusses the utility of juvenile sex offender registration and notification laws and the underlying misconceptions dispelled by social science research.

A. Current Juvenile Sex Offender Laws

When sex offender registration and notification laws were first mentioned and drafted, justice-involved youth who committed sex crimes were not typically included. Unfortunately, two “tough on crime” policies united, trapping juveniles charged with sex offenses by leading to their inclusion in sex offender registration and notification laws. The first policy targeted violent youth offenders, and the second policy focused specifically on sex offenders. A movement to protect children ultimately led to the creation of laws that also targeted them.

All fifty states currently require adults convicted of certain sex offenses to register as sex offenders in their jurisdiction. Similarly, at least thirty-eight states register youth who have committed a sex offense and have been adjudicated delinquent in juvenile court or convicted in adult court. As of 2011, at least twenty-seven states require juveniles adjudicated delinquent to register as sex offenders if they commit a crime that would mandate registration as an adult. Some jurisdictions adopted harsher sanctions like requiring public internet registration or registration regardless of age. For example, children as young as nine years old can be required to register as a sex offender if they are adjudicated delinquent in juvenile court. Some

34 Id. at 17.
36 Public internet registration means that the youth offender’s private information is available to the public. This can include the individual’s photograph, address, and offense history. See also HUMAN RIGHTS WATCH, supra note 1, at 42; Dylan Walsh, The Crimes of Children, THE ATLANTIC, Aug. 2015, https://www.theatlantic.com/politics/archive/2015/08/the-crimes-of-children/398543/ [https://perma.cc/JDL6-9T5Y] (explaining the collateral consequences of registering as a sex offender including deportation after a sentence is served).
37 HUMAN RIGHTS WATCH, supra note 1, at 33.
states also require the transfer of sex offender registration if the youth moves from one jurisdiction to another.37

A shift recently occurred in the legal environment regarding juvenile sex offenders. In addition to fifteen jurisdictions that do not require any juveniles who are adjudicated delinquent to register as sex offenders,38 two state supreme courts held that lifetime registration for youth who commit sex offenses is unconstitutional.39 The Supreme Court of Pennsylvania held that the lifetime registration provision in SORNA violated the due process rights of youth who commit sex offenses because the law relied on the notion that youth sex offenders are at a high risk of recidivism—an irrebuttable presumption that is not “universally true.” 40 Similarly, the Supreme Court of New Jersey held that the statute requiring lifetime registration and community notification for youth who commit certain sex offenses violated the state constitution’s substantive due process guarantee.41 The court subsequently acknowledged that social science research and evidence in the case demonstrated that youth who commit sex crimes are less likely to reoffend than adults.42 As a result, by permanently branding these youth as sex offenders, the law prevented adolescents from finding employment, becoming accepted in their communities, forming

37 Id. at 70; see QUYEN NGUYEN AND NICOLE PITTMAN, A SNAPSHOT OF JUVENILE SEX OFFENDER REGISTRATION AND NOTIFICATION LAWS: A SURVEY OF THE UNITED STATES 68, 92 (Kirsten S. Roulholt et al. eds., 2011) (giving a comprehensive overview of Juvenile Sex Offender laws).
38 Juvenile Sex Offender Registration and SORNA, supra note 34. These fifteen jurisdictions are Alaska, Connecticut, Georgia, Hawaii, Maine, Nebraska, New Mexico, New York, Pennsylvania, Tennessee, Vermont, West Virginia, District of Columbia, Guam, and Puerto Rico. However, it is important to note that this does not apply to juveniles transferred to adult court and convicted as adults for the purpose of sex offender registration.
40 In re J.B., 107 A.3d at 14 (stating that not all juvenile offenders “pose a high risk of committing additional sexual offenses” as indicated by the Pennsylvania statute).
41 The type of sex offenses that are included are defined in the federal SORNA act, but can vary slightly by state law. According to SORNA, a “sex offense” means crimes having “an element involving a sexual act or contact with another.” 42 U.S.C. § 16911(5)(A)(i). A “specified offense against a minor” includes “video voyeurism,” “possession, production, or distribution of child pornography,” and “[a]ny conduct that by its nature is a sex offense against a minor.” 42 U.S.C. § 16911(7)(F)–(G); see In re C.K., 182 A.3d at 934.
42 In re C.K., 182 A.3d at 934.
relationships with others, and maintaining their self-esteem. In other words, the law resulted in youth sex offenders becoming “social pariah[s].”

**B. Harsh Juvenile Sex Offender Legislation is Harmful to Youth**

Sex offender legislation was originally created with the intention of protecting vulnerable youth. However, youth who offend may also suffer unintended consequences from these laws. Research has demonstrated that juvenile sex offender registration negatively impacts youth in both the short-term and long-term. In the short-term, SORNA registration interferes with education, as the child may have to move schools or drop out, leads to stigmatization and isolation due to the label of “sex offender,” and may cause the youth and his or her family to lose their housing due to residency restrictions. Long-term, youth required to register as sex offenders experience pervasive economic consequences due to the difficulty of finding gainful employment, as well as detrimental, lifelong psychological effects. Despite these findings, juvenile sex offender registration continues in the face of little evidence to validate that these laws fulfill their intended purpose: keeping children safer.

**III. SOCIAL SCIENCE RESEARCH AND REFORM EFFORTS REGARDING JUSTICE-INVOLVED YOUTH**

The Supreme Court’s jurisprudence in *Miller v. Alabama* suggested that “juveniles are unique.” Similarly, in the words of Justice Kagan, it is important to consider youths’ “chronological age and its hallmark features—

567 U.S. 460, 465 (2012) (holding that the mandatory sentencing of juveniles to life without parole is unconstitutional). The government needs to examine the circumstances of every youth during sentencing because “juveniles are different.” *Id.*
among them, immaturity, impetuosity, and failure to appreciate risks and consequences.\textsuperscript{50} It is also important to continuously evaluate current law and its alignment with what is known about development over the human lifespan. Considerable psychological research suggests that during adolescent development, there is increased risk-taking behavior that tends to dissipate as the individual matures.\textsuperscript{51} As such, considering youth offenders as a whole is essential in understanding the nuances of those juveniles who commit sex offenses.

Section A examines the social science literature about justice-involved youth generally.\textsuperscript{52} A deeper analysis regarding the literature of youth who commit sex offenses is contained in Section B.\textsuperscript{53} Section C looks specifically at research and the relevant law regarding same-sex juvenile sex offenses.\textsuperscript{54}

\textbf{A. Research Concerning Justice-Involved Youth and Youth in General}

Although eighteen is considered the all-powerful age when youth become adults, both in the eyes of society and in the eyes of the legal system (for most purposes), neurological research has demonstrated that the prefrontal cortex of the brain is not fully developed until age twenty-five.\textsuperscript{55} The prefrontal cortex is responsible for higher-order thinking, including decision making, impulse control, and planning.\textsuperscript{56} Adolescents do not comprehend and weigh the long-term impact of their decisions; instead, they focus on the immediate consequences.\textsuperscript{57}

\begin{footnotesize}
\begin{enumerate}
\item \textit{Id. at 477; see also Montgomery v. Louisiana}, 136 S. Ct. 718 (2016) (holding that the decision in \textit{Miller} is applied retroactively to individuals who are currently incarcerated after being sentenced to life without parole for crimes they committed as youth).

\item See infra Part III Section B.
\item See infra Part III Section C.
\item Michel Pinard, \textit{The Logistical and Ethical Difficulties of Informing Juveniles about the Collateral Consequences of Adjudications}, 6 Nev. L.J. 1111, 1120 (2006); see also Patrick M. McMullen, \textit{Questioning the Questions: The Impossibility of Police Deception in Interrogations of Juveniles}, 99 NW. U. L. Rev. 971, 975 (2005).
\end{enumerate}
\end{footnotesize}
comprehend the long-term impact of those decisions improves. This is true of all aspects of an individual’s life, including criminal behavior and legal decision making.

The general diminished capacity of juveniles directly relates to poor decision-making and the inability to understand criminal justice policies and practices. For example, in the case of Miranda warnings for juvenile offenders, the “scope and extent of collateral consequences can be difficult to convey to juveniles in such a way that they could understand the long-term effects these consequences could have on their lives.” The body of literature related to these topics is indicative of the impaired ability of youth to make long-term decisions and understand the consequences of involvement with the juvenile justice system.

Despite this, the United States legal system imposes long-lasting punishments on youth offenders, punishing behaviors that may be a part of boundary-testing during adolescence. However, reform efforts have recently shifted the focus of the juvenile justice system from punishment to rehabilitation. These efforts can be seen in the attempt to eliminate juvenile confinement, create more juvenile diversion programs, and focus on eliminating or restricting juvenile sex offender registration.

59 Id.
60 Id.
62 Pinard, supra note 57, at 1120.
63 Id.
65 Juvenile diversion programs are an attempt to thwart a youth’s exposure to the criminal justice system by enrolling the youth in programs during different stages of the adjudication process that are focused on rehabilitation and the implementation of important social services, like addressing food insecurity. Juvenile Diversion Programs, Nat’l Inst. JUSTICE https://www.crimesolutions.gov/PracticeDetails.aspx?ID=87 [https://perma.cc/3958-F634]; Emily Haney-Caron, Diversion Programs Can Help Keep Youth Out of “the System” by Preventing Arrests, Juv. L. Ctr. (Apr. 15, 2016), http://jlc.org/blog/diversion-programs-can-help-keep-youth-out-system-preventing-arrests [https://perma.cc/6AXY-SLPC].
66 See generally HUMAN RIGHTS WATCH, supra note 1.
The logical understanding that youths should be treated differently than adults because they are different dissipates when faced with emotion-inducing sex crimes. In fact, the term “juvenile sex offender” elicits a stronger negative reaction in the mind of the public than simply describing the facts of the sex crime committed by a youth offender. The public and our legal system have successfully demonized sex offenders, and this stigma has attached to youth who commit sex offenses. However, research demonstrates that there are many misconceptions regarding justice-involved youth who commit sex crimes. These misconceptions include that juvenile offenders are more likely to recidivate and commit additional sex crimes, that they are less amenable to treatment and rehabilitation, and that they are more dangerous than other types of youth offenders. The data reveal

---

[2] Id. at 660.

[6] In fact, there are more similarities than differences between general youth offenders and youth offenders who commit sex crimes. See generally Reitzel & Carbonell, supra note 71; Fanniff et al., supra note 7; Nancy G. Calleja, Juvenile Sex and Non-Sex Offenders: A Comparison of Recidivism and Risk, 36 J. Addictions & Offender Counseling 1, 4 (2015).
that these myths are simply not true, and juvenile sex crime rates are not influenced by harsh sex offender registration policies.\textsuperscript{73}

Youth who commit sex offenses are a diverse population and have complex treatment needs.\textsuperscript{74} National statistics indicate these offenders are approximately 80% male.\textsuperscript{75} Approximately 80% of youth who commit sex offenses have some diagnosable mental health disorder that may have gone untreated, and 30%–60% of these young offenders have a cognitive learning disability.\textsuperscript{76} Additionally, youth who sexually offend have often been victims themselves. It is estimated that 40%–80% of these offenders are victims of sexual abuse and 20%–50% are victim of physical abuse.\textsuperscript{77}

With the understanding of these characteristics regarding youth who commit sex offenses and sex crimes generally, it would be incomplete to disregard sexual orientation in the analyses of juvenile sex offenses especially considering that sexuality develops through adolescence.\textsuperscript{78}

\textbf{C. Same-Sex Youth Sex Offenses}

LGBTQ youth experience victimization in schools and the community at higher rates than their heterosexual counterparts.\textsuperscript{79} The oppressive social environment created by this stigma negatively impacts the overall wellbeing

\textsuperscript{75} Adam Brown, \textit{Masculinity is Not Pathology: An Exploration of Masculinity Among Juvenile Sexual Abusers and General Delinquents}, 5 JUV. JUST. 121, 122 (2016).

\textsuperscript{77} Hunter, supra note 74, at 1.

\textsuperscript{78} Deborah L. Tolman & Sarah L. McClelland, \textit{Normative Sexuality Development in Adolescence: A Decade in Review, 2000-2009}, 21 J. RES. ON ADOLESCENCE 242, 243 (2011) (Sexuality development and exploration is a normative piece of adolescence.). Sexual orientation is also discovered and established with the development of sexuality during adolescence. LGBTQ youth experience stigma already. Therefore, it is critical to examine how these LGBTQ youth are affected if they have committed a sexual offense. See Elizabeth M. Saewyc, \textit{Research on Adolescent Sexual Orientation: Development, Health Disparities, Stigma, and Resilience}, 21 J. RES. ON ADOLESCENCE 256, 270 (2011).

of these adolescents. LGBTQ youth are already an at-risk group, but this is compounded by the fact that youth are overrepresented in the juvenile justice system. Even though LGBTQ youth comprise 7%-9% of youth worldwide, they make up 20% of all youth in juvenile justice facilities. Specifically, 3.2% of all boys and 39.4% of all girls in juvenile justice facilities identify as LGBTQ. Furthermore, 85% of LGBTQ and gender non-conforming youths in juvenile justice facilities are youth of color. Among other injustices, these youth suffer from abuse and mistreatment by staff, inadequate health care, challenges with family visitation, abuse by other youth, and inappropriate supervision.

In addition to the isolation and stigmatization youth experience when they are justice-involved, compared to heterosexual youths, LGBTQ youth face the additional challenge of discrimination in sex offense labeling. In recent years, identifying as LGBTQ has become more socially acceptable; however, there was a time when it was against the law for same-sex couples to be intimate. Before the Supreme Court deemed the law unconstitutional in 2003, it was illegal in Texas for two persons of the same sex to engage in certain intimate conduct, even though this intimate conduct was legal for heterosexual couples. Fifteen years later, there are still anti-LGBTQ laws on the books in several states, including seven still in effect in Texas. One
particular law in Texas, the “Romeo and Juliet” provision, provides a defense to statutory rape for heterosexual couples who are close in age but not similarly situated homosexual couples.  

Despite the decrease in explicitly anti-LGBTQ laws, discrimination against LGBTQ individuals still exists. LGBTQ youth are disproportionately labeled as sex offenders due to implicit and explicit biases that persist in our society and criminal justice system. There are very few statistics available, but one research study demonstrated that given the same crime, people are more likely to support sex offender registration for LGBTQ youth than for heterosexual youth offenders. One contributing reason is that LGBTQ youth’s controversial sexual activities create moral outrage in the community. The lack of empirical data on this topic warrants further research to facilitate additional analyses about the acceptability of sex offender registration, their amenability to treatment, and whether the perception of the offender’s dangerousness changes based on the perceived sexual orientation of the offender.

IV. PUBLIC OPINION REGARDING SAME-SEX OFFENDER-VICTIM CRIMES

The youth most likely to enter and be affected by the juvenile justice system are disproportionately part of a minority group. Studies on disparities usually focus on the racial and ethnic backgrounds of justice-involved youth. However, it is essential to consider other diversity components, like biological sex and sexual orientation, especially when

---

90 Tex. Penal Code Ann. § 21.11(b)(1) (West 2017) (providing that “it is an affirmative defense to prosecution [for indecency with a child . . . if] the actor was not more than three years older than the victim and of the opposite sex”) (emphasis added); see Michael J. Higdon, Queer Teens and Legislative Bullies: The Cruel and Invidious Discrimination Behind Heterosexual Statutory Rape Laws, 42 U.C. DAVIS L. REV. 195, 198 (defining “Romeo and Juliet” laws as exceptions to statutory rape laws that “cover consensual adolescent sexual activity involving an adolescent below the age of consent when the sexual partner is another adolescent close in age.”).

94 Joshua Rovner, Disproportionate Minority Contact in the Juvenile Justice System 1 (The Sentencing Project ed., 2014). For example, in 2010, even though African American juveniles comprised 17% of all youth, they account for 31% of all arrests. Id. Similar disparities exist among Latino youth. Id.

discussing crimes that are sexual in nature. Sexual offenses, as discussed previously, are given special considerations and cannot be analyzed in the absence of the underlying biases that arise with sexual orientation.

It is essential to survey the public’s opinions regarding this topic to further investigate the treatment of same-sex offender-victim crimes compared to opposite-sex offender-victim crimes. Given that legislative representatives are elected to represent the morals and values of their constituents, it is crucial to understand the factors people consider when contemplating punishment and rehabilitation for same-sex offenders as compared to opposite-sex offenders of sex crimes.

Section A explains the methodology behind the research study conducted for this article. The results and relevant findings are examined in Section B. A discussion regarding the implications of the data is in Section C.

A. Gathering Data to Inform the Analysis

To account for racial and ethnic disparities inherent in the juvenile justice system while also investigating the question of interest—whether same-sex offender-victim crimes are viewed differently than opposite-sex offender-victim crimes—this article elected to conduct research examining three different offender variables. The main variable of interest, same-sex sexual offenses or opposite-sex sexual offenses, was examined by manipulating the second variable, biological sex of the offender as either male or female. This resulted in the creation of four scenarios: male youth offender committing a sex offense against a female youth, male youth offender committing a sex offense against a male youth, female youth offender committing a sex offense against a male youth, and female youth offender committing a sex offense against a female youth. The race of the youth offender was specified as either white or black. The race of the victim was not explicitly stated. This resulted in eight different hypothetical scenarios based on the facts of a real-world juvenile sex offender case where the youth was required to register.

101 See In re T.H., 913 N.W.2d 578, 580 (2018). This case concerned two opposite sex minors: I.N., a sixteen-year-old girl, and T.H., a fourteen-year-old boy. Id. They were talking
The survey created for this study was disseminated using Amazon Mechanical Turk (MTurk). Each participant was randomly assigned to read one of the eight vignettes and answer follow-up questions regarding (1) the acceptability of requiring the youth to register as a sex offender, (2) their fear of the offender, (3) appropriate notification requirements, (4) restrictions for the offender, (5) the offender’s amenability to treatment, and (6) general risk questions. Before answering the questions, participants were provided with a brief explanation of the sex offender registry and how it is enforced. The survey included a demographics questionnaire and manipulation checks to ensure participants were attending to the details of the vignette. Data were collected from 952 participants and results were analyzed using the IBM SPSS Statistical program.

After excluding data from the individuals who did not pass the four manipulation checks, the final sample included 205 participants. On average, participants took approximately 5.91 minutes to complete the survey. Over half of the sample identified as female, and the average age of the participants was 34.51 years, ranging from eighteen to seventy-five years old. In identifying their race, the participants were mostly white, followed by black, then Asian. Almost 10% of participants identified their ethnicity as Hispanic or Latino. Additionally, 61% of participants indicated
they had a college degree and some graduate school experience.\textsuperscript{110} Furthermore, 5.9% of participants reported working in the legal system,\textsuperscript{111} and 29.8% reported having close friends or family members who worked in the legal system.\textsuperscript{112} When asked whether they have ever committed a sex offense, 3.4% of participants indicated they had, and 2.9% of participants stated that they had to register as a sex offender. An additional 27.8% of participants reported that they knew someone who had been convicted of a sex offense, and 19.5% indicated that the individual was placed on the sex offender registry. Of those who responded to the questions about checking the sex offender registry, 53.2%\textsuperscript{113} stated they had checked the sex offender registry in their area and almost 10%\textsuperscript{114} indicated that, upon learning information from the registry, they changed their daily habits. These changes included altering their walking routes, building a privacy fence, establishing a self-imposed curfew, preventing their children from playing outside, and pointing out individuals in public who they knew were on the registry “so everyone knows” who they are.

\section*{B. Understanding the Results}

In general, participants viewed youth who commit sex crimes negatively, indicating beliefs that people who commit sex offenses will likely recidivate\textsuperscript{115} and that the offending youth in the vignette they reviewed is not capable of rehabilitation.\textsuperscript{116} Although undecided on whether they feared the offending youth,\textsuperscript{117} on average, participants agreed with registering the youth

\begin{itemize}
  \item \textsuperscript{110} This sample was more educated than the national average with 45.4\% completing graduate school and 20.5\% completing some graduate school. See Camille L. Ryan and Kurt Bauman, \textit{Educational Attainment in the United States: 2015}, U.S. CENSUS BUREAU 1, 1 (2016) (stating that the majority of adults in the U.S. have completed high school or some college).
  \item \textsuperscript{111} These participants' professions included a probation officer, police officer, paralegal, and attorney.
  \item \textsuperscript{112} Individuals reported that they had close friends or family members who worked as a police officer, forensic accountant, judge, attorney, corrections officer, court reporter, or social worker.
  \item \textsuperscript{113} Out of the 205 participants, 109 individuals had checked the sex offender registry, 88 people had not checked it at all, 3 people preferred not to answer, and 5 people left this question blank.
  \item \textsuperscript{114} 9.8\% of the total sample changed their daily habits after checking the sex offender registry in their area.
  \item \textsuperscript{115} Participants agreed with the statement that people who commit sex crimes are likely to commit another sex crime ($M = 4.04; SD = 0.791$).
  \item \textsuperscript{116} Participants disagreed with the statement that with the right support and treatment, the offending youth can change his or her behavior ($M = 2.05; SD = 1.01$).
  \item \textsuperscript{117} Participants were undecided on whether they feared the specific offending youth who was described in the vignette they were given ($M = 2.80; SD = 1.42$).
\end{itemize}
as a sex offender and requiring community notification. Participants somewhat believed that the offending youth should have residency restrictions, and that registering the youth offender resulted in a safer community.

To interpret the data and variables that went into participants’ decision-making process, responses were totaled to create an overall score indicating how much the participant agreed with sex offender registration, notification, and restrictions procedures. The overall model examining the three-way interaction effect—if the sex of the offending youth, the race of the offending youth, and whether the crime was against a victim of the opposite sex or of the same sex explained individuals’ attitudes regarding sex offender registration, notification, and restrictions procedures—was not significant. However, the interaction effect between the sex of the offending youth and the sex of the victim on explaining individuals’ attitudes regarding sex offender management procedures trended toward significance. While not statistically significant, offenses committed against victims of the same sex were somewhat indicative of a participant’s increased agreeableness to sex offender management procedures. However, male youth offenders

Participants generally agreed that the offending youth described in the vignette should be registered as a sex offender (M = 3.86; SD = 1.09).

Participants agreed that the community as a whole should be notified of the offending youth’s crime (M = 3.81; SD = 1.17).

Participants somewhat agreed that the offending youth should not be able to live within 1,000 feet of a school or childcare center (M = 3.48; SD = 1.27).

Participants somewhat agreed that registering the offending youth helped to keep the community safer (M = 3.32; SD = 1.15).

This included answers to survey questions asking participants whether the youth should be required to register as a sex offender, whether the community should be notified of the crime committed, whether the youth should be prohibited from residing near a school, etc. The independent variables were sex of the offending youth (male or female), race of the offending youth (white or black), and whether the victim was the same sex or the opposite sex of the offender (same-sex crime or opposite-sex crime). This dependent variable met all necessary assumptions for running a 2 x 2 x 2 between-subjects analysis of variance, including normality and homogeneity of variances.

F (1, 204) = 0.02, p = 0.883, η² ≤ .001.

F (1, 204) = 3.40, p = 0.067, η² = .017. The remaining interactions were not significant. The interaction of the race of the offending youth and sex of the offending youth on participants’ agreeableness with sex offender registration, notification, and restrictions policies was not significant, F (1, 204) = 0.48, p = 0.489, η² = .002. The interaction of whether the crime was committed against a victim of the same sex or the opposite sex of the perpetrator and the race of the offending youth on participants’ agreeableness with sex offender registration, notification, and restrictions policies was also not significant, F (1, 204) = 2.84, p = 0.094, η² = .014.

Agreeableness to sex offender registration, notification, and restrictions policies was measured out of a total of 30 points. Scores from 0 to 6 indicated “Strongly Disagree.” Scores
committing a sex crime against a female victim resulted in the highest average participant agreeableness to sex offender management procedures.126

C. What the Data Reveal About the Treatment of Same-Sex Offender-Victim Crimes

In addition to the disparate treatment of LGBTQ and minority youth in the justice system, as discussed in this article,127 there is a societal stigma in the United States facing youth who commit sex offenses.128 This research study was conducted to discover whether the public opinion of youth who commit sex offenses is affected by the race of the offending youth and whether the victim of the crime is the same sex or the opposite sex of the perpetrator. Although this data analysis did not find an interaction between the race of the offending youth, the sex of the offending youth, and whether the victim was the same sex as the offending youth or the opposite sex, interesting and important conclusions were still drawn from these results.

This study examined the public’s opinion regarding nuanced beliefs about registration, notification, and restrictions for youth who commit sex offenses depending on variables surrounding the victim and the offender. The public generally agrees with SORNA practices, believing that youth who commit sex offenses should register as sex offenders and that the public should be notified of their crimes. It appears, however, that participants may have broader views regarding sex offender registration and notification requirements for youth who commit sex crimes. These opinions about sex offender management procedures for youth did not vary whether the youth is black, white, male, female, or whether the youth has committed a crime against a victim of the same sex or the opposite sex.

Contrary to the hypothesis for this research and the results of a previous research study,129 this data analysis did not reveal an interaction between the sex of the offender and whether people believed same-sex

---

126 Participants agreed the most with sex offender policies for male offenders who commit sex crimes against female victims (M = 23.24; SD = 5.09). Although slightly lower, participants also agreed with sex offender policies for females who commit sex crimes against male victims (M = 20.75; SD = 6.19).

129 See generally Salerno et al., supra note 8.
offenders should be punished more harshly. Previous research querying participants about punishment, moral outrage, and explicit LGBTQ stereotypes found that during a consensual sexual encounter between two juveniles, participants were more likely to support sex offender registration for the LGBTQ youth than the heterosexual youth. This was not translated to a same-sex encounter between two female youth. As the current study was interested in unconscious homophobic biases, there were no explicit references or language discussing homosexual relationships. Instead, the only information given regarding the possible sexual orientation of the offender was in the details of the vignette, stating the sex of the victim and the sex of the offender. This intentional nondisclosure of the offender’s sexual orientation and absence of homosexual follow-up questions regarding same-sex encounters may have contributed to lack of an interaction in the same-sex offender-victim and opposite-sex offender-victim variable.

The findings from this research must be interpreted while also acknowledging its limitations. First, the vignette used in this study was based on a real-world case where a youth committed a contact sexual offense against a peer. The lack of variability in the participants’ opinions regarding SORNA practices may show that the crime described was too severe, leaving no room for participants to consider leniency or gradation of punishment. Additionally, the attrition rate of this study, after the manipulation check, was nearly 80%. The participant sample that remained and completed the study was more educated than the national average. While it is not certain why that was, it may be due to the fact that sex crimes and punishment for those who commit sex offenses is an emotionally charged issue, and participants who attended to the details of the survey were somewhat invested or interested in the topic.

Furthermore, SORNA procedures and the various aspects of registration, notification, and restrictions (e.g., residency restrictions, school attendance) are complicated and vary by jurisdiction. Despite being given the paragraph of background information, it may be that participants completed the survey with varying degrees of knowledge regarding the topic. Due to the high number of participants who failed the manipulation check, there was a shortage of data on which to run the analysis. Considering two of the interactions were approaching significance, it may be the case that with a larger sample size and more statistical power, an interaction would be detected between the variables of interest and the public’s agreement with

registration, notification, and management procedures for youth who commit sex offenses.

V. CONCLUSION: A PROPOSED SOLUTION—EQUAL TREATMENT FOR ALL YOUTH WHO COMMIT SEX CRIMES

The lack of groundbreaking findings in this research inquiry does not mean disparate treatment of youth who commit sex crimes does not exist. In fact, the data suggests it is quite the opposite. Regardless of the characteristics of the offender, the public is of the opinion that youth who commit sex offenses against a peer should be subject to, at the very least, sex offender registration and notification procedures. This rings true for males, females, youth of color, and youth who may be members of the LGBTQ community. Despite the overwhelming evidence that registration, notification, and monitoring procedures for youth who commit sex crimes do not keep communities safer and have detrimental long-term consequences, it appears that the general public has not been persuaded.

In March 2019, the National Council of Juvenile and Family Court Judges (NCJFCJ) released a resolution regarding sex offender registration requirements for youth offenders. This document acknowledged the current state of the social science research and legal practice regarding youth who commit sex offenses and stated ten decrees on how juvenile and family court judges plan to apply the facts in practice. Included in this resolution is the recognition that “placing youth on sex offender registries does not advance public safety and can actually make communities less safe” and that “reoffending rates for youth who offend sexually are extremely low.” Additionally, it recognized that minority youth are disproportionally at risk of being placed on registries and that “the negative collateral consequences of placing youth on sex offender registries are well documented and include

suicide, homelessness, difficulty attending school, unemployment, and increased risk of being the victim of sexual abuse." In an effort to right these injustices, the NCJFCJ agreed to support efforts to prevent youth from being placed on sex offender registries and promote evidence-based interventions and treatment programs for youth who commit sex crimes.

Most importantly, this resolution urged Congress to restore judicial discretion for registration cases involving youth who commit sex offenses so that decisions can be made on a case-by-case basis and be guided by sexual offending risk assessments. The resolution also encouraged the government to drastically limit the number of youths considered for sex offender registration and allow individuals whose crimes were committed before the age of eighteen to petition to be removed from sex offender registries.

This resolution is a step in the right direction because it applies research to legal practice in an effort to restore the juvenile justice system to the purpose for which it was originally created: to help children in trouble.

Even though the judicial system is moving toward change, a dramatic shift in the societal dialogue around youth who commit sex offenses needs to occur to lessen the public outcry and public opinion that spurred the creation of these harsh laws in the first place.

Without public support, it is difficult, though not impossible, to create the legislative motivation to amend or repeal SORNA laws. Despite efforts by advocates, the stigma and stereotypes around sexually offending youth still remain strong in the public sphere. To continue to dispel myths surrounding youth who commit sex crimes and create public support for rehabilitative practices, the public must be educated about this issue and the collateral consequences of justice involvement for these youths. As less culpable individuals, all youth need to be treated as what they are: children. As youth who commit sex crimes are often victims themselves, a focus on preventative care, evidence-based treatment programs, and rehabilitative practices will lead to fewer overall victims of the criminal justice system.
